These search terms have been highlighted: **program instantiation**

Instantiation

Instantiation is the process by which individual objects are created. The system uses the class as the abstract description, or "blueprint," by which to create individual *instances*, or *objects*, of that class type. Thus, there is normally a many-to-one relationship between instances of objects and the class from which those objects are derived. Furthermore, instances may be created at any time during the execution of the **program**.

Instantiation. Shows multiple objects (instances) derived from a single class.

The opposite of **instantiation** is *garbage collection*. It is the process by which the system gets rid of objects that are no longer needed and reclaims resources (e.g., space) allocated to those objects.
